

Team Technology - Zapotec Dictionary Documentation

V1.0 by Kelly Clingan & Millie Marsh

June 11, 2025

Current Workflow - Back-End:

-  Zapotec Dictionary
 - This contains all the words that are included in the dictionary. The code is set so that the spreadsheet is dynamic, or in other words, when you add a word to the spreadsheet, it will automatically be added to the Dictionary.
 - 1. On the last completed row, double-click on the row number on the left-hand side.
 - a. Press “Insert 1 row below” to create a new row
 - 2. Fill out the word information.
 - 3. The word should be added to the Dictionary website (make sure to refresh!)
- *DropBox*: This is where all of the audio files are stored
 - 1. **Ensure that the audio files are in .mp3**
 - You can use an online converter or Apple Music (if you have a Mac)
 - 2. Once the file is in .mp3, get the shareable link from Dropbox
 - Change the *dl=0* ending in the link to *raw=1* to make it embeddable in the spreadsheet.
 - 3. Paste the new link with the *raw=1* under Column F in the spreadsheet in the row you would like.
 - 4. The audio should work as planned.
- *App Script*: This is where the application development sits.
 - Note: I have already worked on the code and debugged it accordingly, so I do not foresee significant problems with the code if it is used in the same manner as designed. However, if they do arise, feel free to contact me (contact info at the bottom) or use online resources (Stack Overflow and other HTML/CSS sites) to debug. I used three 3 different languages (HTML, CSS, and JavaScript) to create the website - HTML for structure, CSS for style, JavaScript for the actions executed so there are plenty of resources available if a problem arises. I also left comments in my code so you can understand what’s going on.
 - .GS FILE:
 - This file calls the data from the spreadsheet to appear on the website.
 - .HTML FILE:
 - This is the main file that you will edit if you want to make a change to the code. Here are instructions on how to make a change and have it reflect on the website (deploy your website).
 - 1. Finish your edits. Press the printer button to “Save Project to Drive.” Go to the [Code.GS](#) file and press “Run” to catch any errors.

2. Press the right side of the blue “Deploy” button in the top right corner to get to the drop-down. Select “Manage Deployments.”
3. Press the pencil button in the top right. Go to the Version Drop-down and select “New Version.” Add a description if you’d like.
4. Press the “Deploy” button and you’re done!

How-to: Transcription:

Useful Websites:

[IPA Keyboard](#) - use this for being able to type the transcriptions

[IPA Chart](#) - great for understanding what parts of your mouth are used for each sound; can also listen to pronunciations

- Hover over any letter and it will explain what it is

[IPA Pronunciations](#) - only has American English, but still helpful

[IPA Reader](#) - can use this to hear what your transcription sounds like, but has a very basic skill set and sometimes pronounces words wrong

- (1) Listen the audio of the word several times, or say it aloud to yourself
- (2) Break down the sounds and find the IPA letter that corresponds to that sound
 - (a) Sounds change when paired with different vowels and consonants, so don’t get stumped if you initially do not know what it sounds like!
- (3) Write your transcription in-between slashes //
- (4) Remember that different people pronounce the same words differently, so some transcriptions for the same word will look different!

Here is a table with the common sounds found in Ambrocio’s writing system:

Letter	IPA letter	Letter	IPA letter
b	[β] or [b]	p	[p]
d	[d]	t	[t]
xh	[ʒ]	k	[k]
dx	[dʒ]	x	[ʃ]
r	[r]	tx	[tʃ]
rr	[r]	ll	[l:]
y	[j] or [ɹ]	nn	[n:]
j	[x]		

Note: these are not always true; make sure to listen and analyze before choosing the IPA representation

Current Features (as of Version 45) - HTML, CSS, and Java:

- Search box: You can type any Zapotec or English word to filter dictionary entries instantly.
- Clear button: Quickly erase the search box to start fresh.
- Highlighted matches: When you search, the matching words or parts of words are highlighted in yellow to help you spot them.
- Result count: It tells you how many dictionary entries matched your search.
- No results message: If nothing matches, it displays: “No results found.”
- Audio playback: If there is an audio recording for a word, you get a play button to listen to the pronunciation.
- Keyboard navigation: Pressing “Enter” after typing in the search box scrolls you smoothly to the first dictionary entry, improving accessibility.
- Footer image: A logo or visual that sits nicely at the bottom for branding.

Ideas for Future Iterations:

- Word of the day
- Word in a sample sentence
- Notes spacing (where do we want a new line?)
- Word submission ideas from community
- Groups for words - ie. Part of Speech, Categories (food, sports, etc.)

Plan for Implementation:

- Collaborators (3-5) have edit access to all (spreadsheet, code, and Dropbox)
- Viewers ONLY have access to the website via QR code
- Approval/stage gate process for new submissions, and who is responsible (final approver?)
- General website upkeep: stakeholders on both the Colorado and Teotitlán sides (i.e., three people on each side who are directly accountable - possibly a linguist, SWE, and implementation/strategy person for each side?)

Contact Information:

Note: We're both happy to help with any part of the project, but in general, reach out to Millie for questions about transcription or IPA, and to Kelly for back-end or code-related issues, since those were the areas we each originally worked on.
